DETAILED ACTION

Allowable Subject Matter

1. Claims 1-16 are allowed.
2. The following is an examiner's statement of reasons for allowance:

None of the references of record, alone or in combination, suggest or fairly teach the limitations of independent claim 1 in such a manner that a rejection under 35 U.S.C. 102 or 103 would be proper. Although the prior art discloses a recording pulse generator comprising: a first delay line having plural circuit elements cascaded in multiple stages, wherein the first delay line, outputs plural output clocks each having different phase differences with a clock inputted to the first stage of the first delay line, according to the number of stages of the plural circuit elements thereof, the prior art fails to disclose a level shift stage that shifts the levels of the plural output clocks to generate plural fine clocks, respectively; a selector means that selects an arbitrary fine clock from the plural fine clocks generated; and a recording pulse generator that generates a recording pulse on the basis of a fine clock selected.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Citation of Relevant Prior Art

3. The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.

Gushima et al. (US PGPub Number 2004/0165508 A1) disclose a recording pulse generator comprising a clock delay section. In the clock delay section, an inverter element is connected in series in a plurality of taps. A clock acting as an external input is connected to the inverter element in a first tap. The number of the taps of the inverter element is set such that at least a delay amount to satisfy the variable range of each edge position of the recording pulses can be obtained.

Takehara et al. (US PGPub Number 2003/0174621 A1) disclose a waveform generator having a plurality of delay circuits which receive a decoding signal d from the Viterbi decoder, a plurality of amplifier circuits provided to be connected to these delay circuits, and an adder which receives outputs from these amplifier circuits. Further, the target waveform generator has a level selector which receives an ideal waveform signal l from the ideal waveform generator and a level shifter which receives level signals corresponding to an amplitude of a shortest mark/space of the level sector.
